

Honors Physics 1 for Scientists and Engineers

Physics 0475, University of Pittsburgh (*Fall 2017*)

Syllabus

Course Information

Meeting Time: Mon, Tue, Wed, Thu, Fri: 11:00-11:50 AM
Thaw Hall 102

Instructor Information

- Lecturer: Prof. Michael Wood-Vasey, wmwv@pitt.edu, Allen Hall 320
Office Hours: Mon, Wed 2:00-3:00pm
- TA: Zixin Yang, ziy8@pitt.edu, Allen Hall 523
Office Hours: Tue, Thu 2:00-4:00pm

Textbook and References

1. “Physics” 5th edition, Volume 1. 2002. Resnick, Halliday, Krane
ISBN 978-0-471-32057-9
This is a significantly older edition. It should be available used online for ~\$60. It’s quite expensive “new” at ~\$150-180 dollars.
2. I will provide some additional supplemental readings during the semester.
Read them.
3. We are fortunate to live in a rich, interconnected time in human history.
There is a wealth of information available online about each of the topics we will cover. I encourage you to pursue additional materials, particularly on issues that you are having trouble understanding initially.

Course Description

This is the first term of a two-term course in university physics. Familiarity with basic physics and calculus will be assumed. Physics 0475, 0476 is the honors version of Physics 0174, 0175. Physics 0475 will cover classical mechanics, oscillating systems, wave motion, gravitation, and thermodynamics. Emphasis will be on those aspects of classical physics that underlie the main developments of modern physics and engineering.

Reading and Homework

Reading and homework assignments will be posted on Courseweb.

Course Structure

Lectures will be interspersed with short exercises and in-class group work. Students are expected to have read the relevant sections of the textbook (listed in the schedule below and on Courseweb) before class.

This class as meeting every weekday in Thaw 102 from 11:00-11:50.

While this course is formally structured as a lecture plus recitation, there's only one recitation, you're all in it, and it meets at the same time of day as lecture. Once to twice a week the TA will lead a recitation. The other days I will interactively lecture.

Participation

In this course you will be responsible for both your own and your colleagues's learning. One way in which you can assist your colleague's learning is to ask questions. If you are confused about something, you are almost definitely not alone. The other key way is to fully participate in in-class interactive discussions, small-group discussions, and interactive voting.

Homework

Each week you will complete a homework assignment that uses the material for the current week and builds on previous material. Discussion with classmates is certainly encouraged, but solutions should be your own. Please list the names of your colleagues with whom you worked on each homework assignments. There is no particularly credit assigned to such a list – this is for your own benefit to acknowledge credit and contributions.

Homework is an opportunity to develop your understanding of the course material. Be honest with yourself about whether or not you fully understand a problem. The exams will test this.

Assignments will be posted to Courseweb.

Exams and Final

There will be three midterms and a cumulative final.

Grading

| Percentage | Component |
|------------|---------------------|
| 25% | Homework |
| 45% | Exams (at 15% each) |
| 30% | Final |

Disabilities

If you have a disability that requires special testing accommodations or other classroom modifications, you need to notify both the instructor and the Disability Resources and Services no later than the 2nd week of the term. You may be asked to provide documentation of your disability to determine the appropriateness of accommodations. To notify Disability Resources and Services, call 648-7890 (Voice or TTD) to schedule an appointment. The Office is located in 216 William Pitt Union.

Academic Integrity

Students in this course will be expected to comply with the University of Pittsburgh's Policy on Academic Integrity. Any student suspected of violating this obligation for any reason during the semester will be required to participate in the procedural process, initiated at the instructor level, as outlined in the University Guidelines on Academic Integrity. This may include, but is not limited to, the confiscation of the examination of any individual suspected of violating University Policy.

Acknowledgments

Attribution and credit is the core currency of respect and recognition in science.

The structure, lectures, assignments and other material in this course are based on an extensive history of physics education over the past 50 years, with roots extending beyond that. More specifically, my resources for this course are strongly based on previous editions of this course taught by Prof. Adam Leibovich and Prof. Arthur Kosowsky.

Similarly, please credit your colleagues with whom you discuss and work with on homework.

Calendar

| Week of | Reading | Planned material |
|---------|------------|--|
| 08/28 | Chp 1 | Dimensional Analysis; Vectors and Motion |
| 09/04 | Chp 2, 3 | Kinematics and Dynamics <i>No class Sep 4 (Labor Day). Add/drop period ends Sep 8</i> |
| 09/11 | Chp 3, 4 | More Dynamics |
| 09/18 | Chp 5 | Friction and Viscosity |
| 09/25 | | <i>Exam 1, Fri Sep 29</i> |
| 10/02 | Chp 6 | Momentum |
| 10/09 | Chp 8, 9 | Rotational Kinematics <i>No Class Mon: Oct 9</i> |
| 10/16 | Chp 9, 10 | Angular Momentum |
| 10/23 | Chp 11, 12 | Work and Energy |
| 10/30 | | <i>Exam 2, Fri, Nov 3</i> |
| 11/06 | Chp 14 | Gravity |
| 11/13 | Chp 17, 18 | Springs and Harmonic Motion; Waves |
| 11/20 | Chp 19 | Sound Waves <i>No class Nov 22-24 (Thanksgiving)</i> |
| 11/27 | | <i>Exam 3, Fri, Dec 1</i> |
| 12/04 | Chp 20 | Special Relativity |
| 12/12 | FINAL EXAM | Tuesday 12:00-01:50 |

Learning Objectives

Learning objectives are the list of things that you should be able to demonstrate that you can do by the end of this course. You might thus choose to call this section the “Study Guide”. After completion of course students will be able to:

1. Evaluate, using dimensional analysis, which key parameters are needed to understand a new problem.
2. Create an estimate for an approximate answer when faced with an unfamiliar problem.
3. Make a graph of the instantaneous displacement, velocity, and/or acceleration of a system based on a description of the motion or using another graph.
4. Apply the equations of 1-D kinematics to one or more objects with constant acceleration. E.g., free-fall, two objects that meet one another, and an object that has different constant acceleration at different times.
5. Add or subtract two or more vectors. (Relative velocity problems are an application of this category.)
6. Calculate the dot product or cross product of two vectors.
7. Describe the behavior of an object undergoing projectile motion based on the equations of 3-D kinematics.
8. Apply a conceptual understanding of Newton’s first and third law.
9. Draw a free-body diagram and solve for an unknown force or acceleration of a system under the influence of two or more forces.
10. Apply the equations of 3-D kinematics to one or more objects. E.g., when are the forces in a system balanced? where will an object impact a wall given an initial position, velocity, and force?.
11. Integrate a specified time-dependent force, together with specified initial position and velocity, to determine the position of an object over time.
12. Calculate the force of static/kinetic friction or the coefficient of friction.
13. Calculate the drag force or terminal speed of an object.
14. Identify the centripetal force that acts on a system undergoing circular motion.
15. Evaluate when the limits of a system are reached. E.g., when does a rope go slack, when does an object stop/start accelerating, how quickly can an car make a turn on an inclined bank?
16. Find the work done by a force.
17. Calculate the average power provided by a force.
18. Apply conservation of mechanical energy to describe the motion of a system.
19. Use the work-energy theorem to identify the amount of mechanical energy that has been lost.
20. Calculate the average force during a collision or series of collisions.
21. Apply conservation of momentum to an explosion or collision. Identify

- whether a collision is elastic, inelastic, or completely inelastic.
22. Answer a conceptual question about momentum, rockets, and/or the motion of the center of mass.
 23. Apply kinematics to a rotating system. Covert between the tangential values of s , v , a and θ , ω , and α using the radius r .
 24. Distinguish between angular, tangential, and centripetal acceleration.
 25. Determine the net torque acting on a body about a given axis and/or the angular acceleration of that body. Doing so may require the use of one or more moments of inertia.
 26. Use the definition of static equilibrium to solve for one or more unknown forces or torques acting on a system.
 27. Calculate the motion of a rolling object using torques and/or energy conservation. "Rolling" could be due to external contact or caused by a cord wrapped around the object, like in a yo-yo.
 28. Calculate the rotational kinetic energy of an object.
 29. Identify whether angular momentum is or is not conserved, and if appropriate, apply conservation of angular momentum to a rotating system. Calculate the gravitation acceleration for an object inside or outside of a planet, given some combination of mass, radius, and density.
 30. Apply energy conservation to a system with gravity to describe the motion of an object in a case where $U = mg$ is not an appropriate assumption.
 31. Use Kepler's laws of planetary motion to describe the motion of a planet, moon, or satellite about its parent body.
 32. Apply the concepts of stress, strain, and ultimate strength to a deformed object.
 33. Calculate a spring constant given the elastic properties of a material.
 34. Identify when a system (spring, simple pendulum, or physical pendulum) is undergoing simple harmonic motion, and find the amplitude, period, frequency, angular frequency, phase angle, displacement, velocity, and/or acceleration.
 35. Apply conservation of mechanical energy to a simple harmonic oscillator (spring, simple pendulum, or physical pendulum) with damping.
 36. Determine the amplitude, period, frequency, angular frequency, wave number, wave length, and/or propagation speed of a transverse traveling wave. If the wave is on a string, calculate the propagation speed using the tension and linear density.
 37. Predict the result of interference between two waves with identical amplitude and frequency. Specifically, identify constructive, destructive, and intermediate interference - determine the amplitude and/or phase difference in the later case.
 38. Identify the resonant frequencies and/or harmonics of a string or an open or closed pipe.
 39. Apply the equation for the Doppler effect to determine the shift in frequency caused by motion.
